

NOMURA TECH GRADUATE PROGRAM 2026

Next-Generation Trading Platform with Straight-Through Processing

A 3-week cross-functional project for technology and corporate graduates to design, build, and present an MVP trading platform.

OVERVIEW

What we're building

Nomura aims to build a modern trading platform with Straight-Through Processing (STP) capabilities, integrating all products traded on behalf of clients.

The platform will support Order Execution, Portfolio Management, Reporting and Charting, Technical Analytics, and paper trading for strategy development.

The solution leverages cutting-edge technologies — incorporating Generative AI (GenAI), cloud computing, and DevOps practices to ensure scalability, performance, and operational efficiency.

OBJECTIVES

What we're trying to achieve

Cross-team collaboration

Foster collaboration between technology and corporate graduates.

GenAI-powered platform

Leverage GenAI and emerging technologies to enhance efficiency and client experience.

Operational frameworks

Develop processes to ensure seamless operational support for the platform.

Graduate development

Equip graduates with hands-on experience in project management, problem-solving, and communication.

DELIVERABLES

What we'll deliver

MVP Trading Platform with STP capabilities

A functional platform covering five core modules:

- Order Execution

- Portfolio Management

- Reporting & Charting

- Technical Analytics

- Paper Trading

2 Operational workflow documentation

Detailed workflows covering trade settlement, risk management, and system access supporting the platform.

3 Final team presentation

Covering platform features, operational processes, and future roadmap recommendations.

EXPECTED OUTCOMES

What success looks like

- A functional, forward-looking trading platform that demonstrates practical application of GenAI, Agile, and DevOps practices.
- Strong understanding of trading processes with effective integration of business and technology workflows.
- High levels of collaboration, communication, and cross-functional alignment across the team.
- Platform designed to support future scalability and operational readiness.
- Team presentation delivered at the end of the program showcasing all deliverables.

ROLES & RESPONSIBILITIES

Who does what

TECHNOLOGY ANALYSTS

Build the platform

RESPONSIBILITIES

- Design and develop the trading platform with STP capabilities
- Implement GenAI solutions to enhance trading efficiency
- Build scalable infrastructure with DevOps and Cloud
- Data analysis and visualisation for operational insights
- Manage version-controlled codebases with Git and GitLab
- Containerise solutions using Docker
- Automate deployment with Terraform and CI/CD pipelines

KEY SKILLS GAINED

Python

GenAI

Cloud

DevOps

Docker

GitLab CI/CD

Terraform

CORPORATE ANALYSTS

Define the business

RESPONSIBILITIES

- Map workflows for trade settlement, risk, and system access
- Identify operational requirements for the platform
- Align business processes with platform features
- Analyse compliance and risk management strategies
- Provide insights on lifecycle processes for financial products
- Design and create the final presentation slides

KEY SKILLS GAINED

Trade lifecycle

Risk management

Compliance

Cross-functional comms

Strategic thinking

STAKEHOLDERS

Voices from the business

Rohan Singh

HEAD OF PRODUCT DEVELOPMENT

"The way in which people are trading has changed over the years, we need to make sure we change the ways in which we capture new opportunities. We want to remain competitive and be able to further utilize new technologies to trade with a single click. If we can build this, it will be a game changer for the industry. We need a system that will be useful to trade on a single click, execute orders, manage portfolios and more. We need a trading system that is able to process trades quickly, provide KPIs, give reports, chart. Speak the language of our users."

Tom Atkins / Patricia Bose

CLIENT / CUSTOMER

"The way we currently trade is quite good. I am not sure why we need to change. Well, it will be good if we could automate things, but I do not want to learn another system. I am used to the commands that I need to execute a trade. Most of the times I ask my secretary to execute something for me anyways. I must say the current way of viewing data going through Excel is quite a task. It would be great to have a dashboard tracking what I am interested in."

Nora Smith

TECH DEVELOPER

"It is a known fact that market prices move not only based on a company's fundamentals but also due to how people feel at certain times. Although this is true, it requires a huge amount of data to build an effective system. It may be quite far-fetched. Building a system that allows trades to be carried out immediately is doable, but challenging. Single handedly building this system from scratch will take at least 6 months. Besides, the current system that batch processes trades is already a handful to maintain by an entire team. The idea is

great, but I am unsure if we can build something effective. Why re-build something that we already have?"

Roy

CTO

"I am so excited about this new system. I fully agree with Rohan. I think we are moving in the right direction. We need more guys in a DevSecOps team, so that we handle this project in the most efficient way possible. Build security, operations, SRE all into this project. I am looking forward to building a system that does not just work, but is robust, user friendly and resilient. Looking forward to this. Just need to get a buy-in from our CFO."

SUPPORT

Facilitator support

Daily touchpoints

Regular check-ins with facilitators for guidance and unblocking.

Live feedback

Structured feedback sessions after each project milestone.

Expert access

Access to subject-matter experts across technology and business.
